Introduction: Pancreatic ductal $\mathrm{HCO}_{3}{ }^{-}$secretion is critically dependent on the cystic fibrosis transmembrane conductance regulator chloride channel (CFTR) and the solute-linked carrier 26 member 6 anion transporter (SLC26A6). Deterioration of $\mathrm{HCO}_{3}^{-}$secretion is observed in chronic pancreatitis (CP), and CFTR mutations increase CP risk.

Aims: Therefore, SLC26A6 is a reasonable candidate for a CP susceptibility gene, which has not been investigated in CP patients so far.

Patients \& methods: As a discovery cohort, 96 subjects with CP and 99 control subjects with no pancreatic disease were recruited from the Hungarian National Pancreas Registry. In 30 non-alcoholic CP cases the entire SLC26A6 coding region was sequenced. Variants c.616G>A (p.V206M) and c.1191C>A (p.P397=) were further genotyped by restriction fragment length polymorphism analysis. A German replication cohort of 321 CP cases and 171 controls was analyzed by sequencing.

Results: Sequencing of the SLC26A6 coding region revealed four common variants: intronic variants $\mathrm{c} .23+71 \_103 \mathrm{del}, \mathrm{c} .183-4 \mathrm{C}>\mathrm{A}, \mathrm{c} .1134+32 \mathrm{C}>\mathrm{A}$, and missense variant $\mathrm{c} .616 \mathrm{G}>\mathrm{A}(\mathrm{p} . \mathrm{V} 206 \mathrm{M})$ which were found in linkage disequilibrium indicating a conserved haplotype. The distribution of the haplotype did not show a significant difference between patients and controls in the two cohorts. A synonymous variant $\mathrm{c} .1191 \mathrm{C}>\mathrm{A}$ (p.P397=) was detected in a single case.

Conclusion: Our data show that SLC26A6 variants do not alter the risk for the development of CP.
